

Synthesized Leray--Hopf agent-harness architecture

Reconstructed from controls introduced at different stages; not one unchanged campaign configuration.

→ forward lifecycle

→ finding / rework

conditional control

SCIENTIFIC AUTHORITY

Scientific owner
scope and merge authority

Read-only scout*
repository assumptions

OWNER-DEFINED GITHUB WORKFLOW GOVERNANCE — predates later Fable phases

SCOPE CONTRACT

GitHub Issue
bounded contract

Statement-contract refinement*

ORCHESTRATION

Orchestrator
model-independent skill + policy routing

Fable used in later phases

IMPLEMENTATION

Issue-scoped Git worktree
exclusive ownership

Pull-request candidate
committed diff

ASSURANCE GATEWAY

Applicable gates
select by changed artifact

Semantic statement review + counterexample search

Lean build + axiom pin + release-surface checks

Review-completion record

Public-declaration comparison*

PROJECT STATE

Merged project state
PR assurance passed

Release candidate

MECHANICAL VERIFICATION

Full-build attestation
separate boundary

Attested release
artifact

RUNTIME GOVERNANCE

Execution plane
applies while work runs

2 local computers + isolated container
on a virtual private server

Separate Git worktrees
exclusive issue ownership

Shared Lean cache
+ global build lock

Liveness checks + process cleanup
available-memory monitoring

EVIDENCE CAPTURE

Evidence rail
append throughout

Session · Issue · PR · review · build · release records
append evidence

Evidence manifest / escrow
traceable record set

Paper claims
owner-approved use

* Conditional: used when repository assumptions, mathematical scope, or the changed public interface require it.
